Applied forecasting for business and economics

Ch2. Time series graphics

OTexts.org/fpp3/

Outline

2

Outline

3

Class packages

```r
# Data manipulation and plotting functions
library(tidyverse)
# Time series manipulation
library(tsibble)
# Forecasting functions
library(fable)
# Time series graphics and statistics
library(feasts)
# Tidy time series data
library(tsibbledata)
```

tsibble objects

A `tsibble` allows storage and manipulation of time series in R.

It contains:

- Measured variable(s): numbers of interest
- Key variable(s): unique identifiers for each series
- An index: time information about the observation

tsibble objects

Example

```
library(tsibble)
y <- tsibble(year = 2012:2016,
  y = c(123,39,78,52,110), index = year)
y
```

```
## # A tsibble: 5 x 2 [1Y]
##     year       y
##    <int> <dbl>
## 1  2012    123
## 2  2013     39
## 3  2014     78
## 4  2015     52
```

The `tsibble` index

Common time index variables can be created with
these functions:

Frequency	Function
Annual	start:end
Quarterly	yearquarter()
Monthly	yearmonth()
Weekly	yearweek()
Daily	as_date(), ymd()
Sub-daily	as_datetime()

The key to many time series

Year	Length	Sex	Time
1896	100m	men	12.0
1928	100m	women	12.2
1900	200m	men	22.2
1948	200m	women	24.4
1896	400m	men	54.2
1964	400m	women	52.0

The key to many time series

```
olympic_running %>% as_tsibble(
  key = id(Length, Sex), index = Year)

## # A tsibble: 312 x 4 [4Y]
## # Key:        Length, Sex [14]
##      Year Length Sex     Time
##     <dbl> <fct>  <chr>  <dbl>
##  1  1896 100m   men     12
##  2  1900 100m   men     11
##  3  1904 100m   men     11
##  4  1908 100m   men     10.8
```

Australian GDP

```r
aus_economy <- global_economy %>%
  filter(Code == "AUS")
```
```
## # A tsibble: 58 x 9 [1Y]
## # Key:       Country [1]
##    Country Code   Year    GDP Growth   CPI
##    <fct>   <fct> <dbl>  <dbl>  <dbl> <dbl>
## 1 Austra~ AUS    1960 1.86e10    NA    7.96
## 2 Austra~ AUS    1961 1.96e10   2.49   8.14
## 3 Austra~ AUS    1962 1.99e10   1.30   8.12
## 4 Austra~ AUS    1963 2.15e10   6.21   8.17
## 5 Austra~ AUS    1964 2.38e10   6.98   8.40
## 6 Austra~ AUS    1965 2.59e10   5.98   8.69
## 7 Austra~ AUS    1966 2.73e10   2.38   8.98
```

Australian GDP

```
aus_economy %>% autoplot(GDP)
```
Outline

Time plots

```
ansett %>%
  filter(Airports=="MEL-SYD", Class=="Economy") %>%
  autoplot(Passengers)
```

```r
a10 <- PBS %>%
  filter(ATC2 == "A10") %>%
  summarise(Cost = sum(Cost)/1e6)
```

```
## # A tsibble: 204 x 2 [1M]
##        Month  Cost
##        <mth> <dbl>
## 1 1991 Jul   3.53
## 2 1991 Aug   3.18
## 3 1991 Sep   3.25
## 4 1991 Oct   3.61
## 5 1991 Nov   3.57
```
Time plots

```
a10 %>% autoplot(Cost) +
  ylab("$ million") + xlab("Year") +
  ggtitle("Antidiabetic drug sales")
```

Antidiabetic drug sales

Your turn

- Create plots of the following time series: Bricks from `aus_production`, Lynx from `pelt`, Google from `gafa_stock`
- Use `help()` to find out about the data in each series.
- For the last plot, modify the axis labels and title.

Are time plots best?

```
maxtemp %>%
  autoplot(Temperature) +
  xlab("Week") + ylab("Max temperature")
```

17

Are time plots best?

```
maxtemp %>%
  ggplot(aes(x = Day, y = Temperature)) +
  geom_point() +
  xlab("Week") + ylab("Max temperature")
```

# Are time plots best?

# Are time plots best?

# Outline

# Seasonal plots

```
a10 %>% ggseasonplot(Cost, labels = "both") +
  ylab("$ million") +
  ggtitle("Seasonal plot: antidiabetic drug sales")
```

Seasonal plot: antidiabetic drug sales

# Seasonal plots

- Data plotted against the individual "seasons" in which the data were observed. (In this case a "season" is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: `ggseasonplot()`

# Seasonal subseries plots

```
a10 %>%
  ggsubseriesplot(Cost) + ylab("$ million") +
  ggtitle("Subseries plot: antidiabetic drug sales")
```

Subseries plot: antidiabetic drug sales
# Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: `ggsubseriesplot()`

# Quarterly Australian Beer Production

```
beer <- aus_production %>%
  select(Quarter, Beer) %>%
  filter(year(Quarter) >= 1992)
beer %>% autoplot(Beer)
```
# Quarterly Australian Beer Production

```
beer %>% ggseasonplot(Beer, labels="right")
```

Quarterly Australian Beer Production

```
beer %>% ggsubseriesplot(Beer)
```

Your turn

Look at the quarterly tourism data for the Snowy Mountains

```
snowy <- filter(tourism,
  Region == "Snowy Mountains",
  Purpose == "Holiday")
```

- Use `autoplot()`, `ggseasonplot()` and `ggsubseriesplot()` to explore the data.
- What do you learn?

Outline

Time series patterns

Trend pattern exists when there is a long-term increase or decrease in the data.

Seasonal pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).

Cyclic pattern exists when data exhibit rises and falls that are *not of fixed period* (duration usually of at least 2 years).

Time series components

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

Time series patterns

```
as_tsibble(fma::elec) %>%
  filter(index >= 1980) %>%
  autoplot(value) + xlab("Year") + ylab("GWh") +
  ggtitle("Australian electricity production")
```

Australian electricity production
Time series patterns

```
aus_production %>%
  autoplot(Bricks) +
  ggtitle("Australian clay brick production") +
  xlab("Year") + ylab("million units")
```

Australian clay brick production

Time series patterns

```r
as_tsibble(fma::hsales) %>%
  autoplot(value) +
  ggtitle("Sales of new one-family houses, USA") +
  xlab("Year") + ylab("Total sales")
```

Sales of new one–family houses, USA

Time series patterns

```r
as_tsibble(fma::ustreas) %>%
  autoplot(value) +
  ggtitle("US Treasury Bill Contracts") +
  xlab("Day") + ylab("price")
```

US Treasury Bill Contracts

Time series patterns

```
pelt %>%
  autoplot(Lynx) +
  ggtitle("Annual Canadian Lynx Trappings") +
  xlab("Year") + ylab("Number trapped")
```

Annual Canadian Lynx Trappings

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

Outline
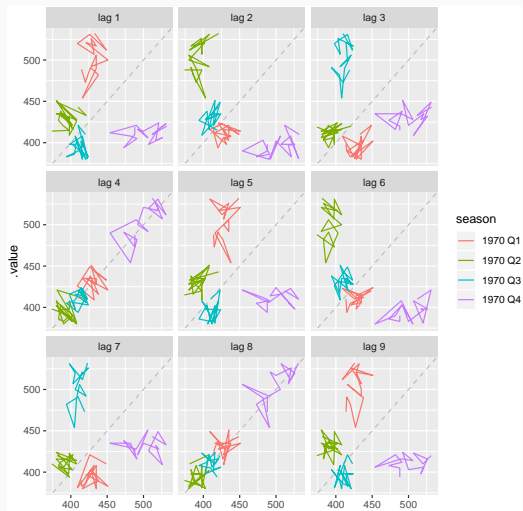

39

Example: Beer production

```
new_production <- aus_production %>%
  filter(year(Quarter) >= 1992)
new_production
```

```
## # A tsibble: 74 x 7 [1Q]
##       Quarter  Beer Tobacco Bricks Cement
##         <qtr> <dbl>   <dbl>  <dbl>  <dbl>
##  1   1992 Q1    443    5777    383   1289
##  2   1992 Q2    410    5853    404   1501
##  3   1992 Q3    420    6416    446   1539
##  4   1992 Q4    532    5825    420   1568
##  5   1993 Q1    433    5724    394   1450
##  6   1993 Q2    421    6036    462   1668
```
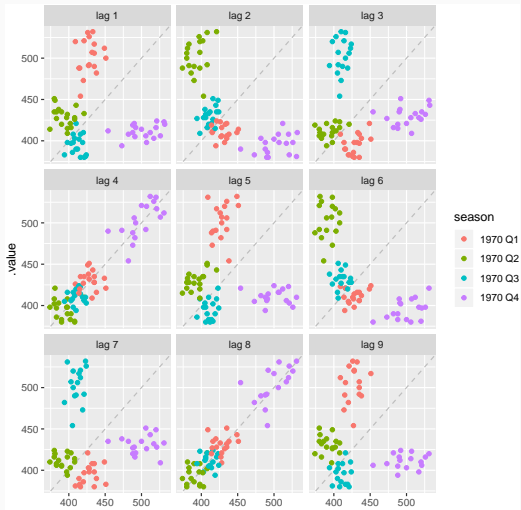

Example: Beer production

```
new_production %>% gglagplot(Beer)
```

Example: Beer production

```
new_production %>% gglagplot(Beer, type='point')
```

Lagged scatterplots

- Each graph shows y_t plotted against y_{t-k} for different values of k.
- The autocorrelations are the correlations associated with these scatterplots.

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (y and X).

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (*y* and *X*).

Autocovariance and **autocorrelation**: measure linear relationship between **lagged values** of a time series *y*.

Autocorrelation

Covariance and **correlation**: measure extent of **linear relationship** between two variables (*y* and *X*).

Autocovariance and **autocorrelation**: measure linear relationship between **lagged values** of a time series *y*.

We measure the relationship between:

- y_t and y_{t-1}
- y_t and y_{t-2}
- y_t and y_{t-3}
- etc.

Autocorrelation

We denote the sample autocovariance at lag k by c_k and the sample autocorrelation at lag k by r_k. Then define

$$c_k = \frac{1}{T} \sum_{t=k+1}^{T} (y_t - \bar{y})(y_{t-k} - \bar{y})$$

and $\quad r_k = c_k / c_0$

Autocorrelation

We denote the sample autocovariance at lag k by c_k and the sample autocorrelation at lag k by r_k. Then define

$$c_k = \frac{1}{T} \sum_{t=k+1}^{T} (y_t - \bar{y})(y_{t-k} - \bar{y})$$

$$\text{and} \qquad r_k = c_k/c_0$$

- r_1 indicates how successive values of y relate to each other
- r_2 indicates how y values two periods apart relate to each other
- r_k is *almost* the same as the sample correlation between y_t and y_{t-k}.

Autocorrelation

Results for first 9 lags for beer data:

```
new_production %>% ACF(Beer, lag_max = 9)

## # A tsibble: 9 x 2 [1Q]
##      lag      acf
##    <lag>    <dbl>
## 1     1Q  -0.102
## 2     2Q  -0.657
## 3     3Q  -0.0603
## 4     4Q   0.869
## 5     5Q  -0.0892
## 6     6Q  -0.635
## 7     7Q  -0.0542
## 8     8Q   0.832
```
# Autocorrelation

Results for first 9 lags for beer data:

```
new_production %>% ACF(Beer, lag_max = 9) %>% autoplot()
```

Autocorrelation

- r_4 higher than for the other lags. This is due to **the seasonal pattern in the data**: the peaks tend to be **4 quarters** apart and the troughs tend to be **2 quarters** apart.
- r_2 is more negative than for the other lags because troughs tend to be 2 quarters behind peaks.
- Together, the autocorrelations at lags 1, 2, ..., make up the *autocorrelation* or ACF.
- The plot is known as a **correlogram**

ACF

```
new_production %>% ACF(Beer) %>% autoplot()
```

Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

Aus monthly electricity production

```
elec2 <- as_tsibble(fma::elec) %>%
  filter(year(index) >= 1980)
elec2 %>% autoplot(value)
```
Aus monthly electricity production

```
elec2 %>% ACF(value, lag_max=48) %>%
  autoplot()
```

Aus monthly electricity production

Time plot shows clear trend and seasonality.

The same features are reflected in the ACF.

- The slowly decaying ACF indicates trend.
- The ACF peaks at lags 12, 24, 36, . . ., indicate seasonality of length 12.

Google stock price

```r
google_2015 <- gafa_stock %>%
  filter(Symbol == "GOOG", year(Date) == 2015) %>%
  select(Date, Close)
google_2015
```

```
## # A tsibble: 252 x 2 [!]
##    Date        Close
##    <date>      <dbl>
##  1 2015-01-02  522.
##  2 2015-01-05  511.
##  3 2015-01-06  499.
##  4 2015-01-07  498.
##  5 2015-01-08  500.
##  6 2015-01-09  493.
```
Google stock price

```
google_2015 %>% autoplot(Close)
```

Google stock price

```
google_2015 %>%
  ACF(Close, lag_max=100)
# Error: Can't handle tsibble of irregular interval.
```

```
google_2015 %>%
  ACF(Close, lag_max=100)
# Error: Can't handle tsibble of irregular interval.
```

```
google_2015
```

```
## # A tsibble: 252 x 2 [!]
##    Date        Close
##    <date>      <dbl>
##  1 2015-01-02   522.
##  2 2015-01-05   511.
##  3 2015-01-06   499.
```
Google stock price

```
google_2015 <- google_2015 %>%
  mutate(trading_day = row_number()) %>%
  update_tsibble(index=trading_day, regular=TRUE)
google_2015
```

```
## # A tsibble: 252 x 3 [1]
##    Date        Close trading_day
##    <date>      <dbl>       <int>
## 1 2015-01-02  522.            1

## 5 2015-01-08  500.            5
## 6 2015-01-09  493.            6
```

Google stock price

```
google_2015 %>%
  ACF(Close, lag_max=100) %>%
  autoplot()
```

Your turn

We have introduced the following functions:
- `gglagplot`
- `ACF`

Explore the following time series using these functions. Can you spot any seasonality, cyclicity and trend? What do you learn about the series?

- Bricks from `aus_production`
- Lynx from `pelt`
- Victorian Electricity Demand from `aus_elec`
Which is which?

1. Daily temperature of cow
2. Monthly accidental deaths
3. Monthly air passengers
4. Annual mink trappings

A B C D

# Outline

Example: White noise

```
wn <- tsibble(t = seq_len(36), y = rnorm(36),
              index = t)
wn %>% autoplot(y)
```

Example: White noise

r_1	r_2	r_3	r_4	r_5	r_6	r_7	r_8	r_9	r_{10}
-0.021	0.228	-0.309	-0.063	-0.197	0.008	-0.175	-0.048	0.000	0.054
Sampling distribution of autocorrelations

Sampling distribution of r_k for white noise data is asymptotically N(0,$1/T$).

Sampling distribution of autocorrelations

Sampling distribution of r_k for white noise data is asymptotically N(0,$1/T$).

- 95% of all r_k for white noise must lie within $\pm 1.96/\sqrt{T}$.
- If this is not the case, the series is probably not WN.
- Common to plot lines at $\pm 1.96/\sqrt{T}$ when plotting ACF. These are the **critical values**.
Example: Pigs slaughtered

```r
pigs <- aus_livestock %>%
  filter(State == "Victoria", Animal == "Pigs",
         year(Month) >= 2014)
pigs %>% autoplot(Count/1e3) +
  xlab("Year") + ylab("Thousands") +
  ggtitle("Number of pigs slaughtered in Victoria")
```

Number of pigs slaughtered in Victoria

Example: Pigs slaughtered

```
pigs %>% ACF(Count) %>% autoplot()
```

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

These show the series is **not a white noise series**.

Your turn

You can compute the daily changes in the Google
stock price in 2018 using

```
dgoog <- gafa_stock %>%
  filter(Symbol == "GOOG", year(Date) >= 2018) %>%
  mutate(trading_day = row_number()) %>%
  update_tsibble(index=trading_day, regular=TRUE) %>%
  mutate(diff = difference(Close))
```

Does diff look like white noise?
